1 Introduction

Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like "Huardest gefburn"? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

Write Introduction

This is the second paragraph. Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like "Huardest gefburn"? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

And after the second paragraph follows the third paragraph. Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like "Huardest gefburn"? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

After this fourth paragraph, we start a new paragraph sequence. Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like "Huardest gefburn"? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

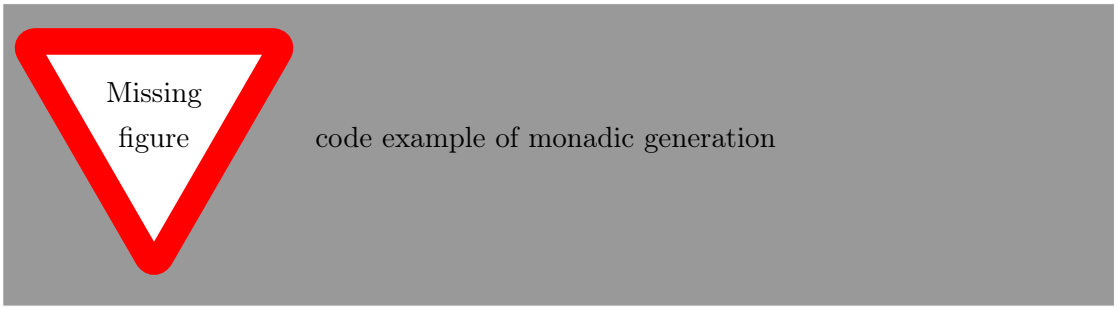
2.1 language-llvm-quote

When writing a compiler using LLVM in Haskell there is a good tutorial on how to do it at `http://www.stephendiehl.com/llvm/`. It uses *llvm-general* to interface with LLVM. The general idea is to use a monadic generator to produce the AST on the fly. This has some obvious drawbacks, as the code can get unreadable pretty quickly.



A solution is to use quasiquotation[5]. That way, one can write the llvm-ir directly, without having to manipulate the AST by hand. This could also be done with a simple parser though. The main advantage of quasiquotation is, the use of antiquotation. They allow you to reference arbitrary Haskell values inside the quotation.

I implemented *language-llvm-quote*, a quasiquotation library for LLVM. The design is inspired by *language-c-quote*, which is also used in the cuda implementation of Accelerate. I use "Happy" and *Alex*.
